N° 451-TEST

NBN EN ISO 17025:2017

EA MLA signatory

**NOISE LAB**  
**REPORT Number A-2021LAB-017-1-2-44273\_E**

**TEST METHOD**

The tests were conducted in accordance with the provisions of the test method EN ISO354:2003. A detailed description of the test set up can be found in the standard.

The measurement method can be simply described as follows:

The reverberation time of the room is determined in 2 situations:

- an empty reflecting room
- a reflecting room with the test sample inside, which is mounted following the different prescriptions specified in the standard

By adding the test sample inside the room, the reverberation time will be shorter. The reduction of reverberation time is a reference for the amount of added absorption.

From these reverberation times, the equivalent sound absorption area of the test specimen, is calculated by using Sabine's equation.  
 Measurement is carried out in ranges of 1/3 octave and interval from 100Hz to 5000Hz.

The equivalent sound absorption area of the empty reverberation room, A<sub>1</sub>, in square metres, shall be calculated using the formula (1) :

$$A_1 = 55,3 V / (c_1 T_1) - 4Vm \quad [m^2] \quad (1)$$

The equivalent sound absorption area of the reverberation room containing a test specimen, A<sub>2</sub>, in square metres, shall be calculated using the formula (2) :

$$A_2 = 55,3 V / (c_2 T_2) - 4Vm \quad [m^2] \quad (2)$$

The equivalent sound absorption area of the test specimen, A<sub>T</sub>, in square metres, shall be calculated using the formula (3) :

$$A_T = A_2 - A_1 = 55,3 V (1/c_2 T_2 - 1/c_1 T_1) - 4V(m_2 - m_1) \quad [m^2] \quad (3)$$

The sound absorption coefficient of a plane absorber or a specified array of test objects shall be calculated using the formula (4):

$$\alpha_s = A_T / S \quad (4)$$

whereas: A<sub>2</sub>, A<sub>1</sub> = the equivalent sound absorption area of respectively the empty reverberation room and the room containing a test specimen [m<sup>2</sup>]  
 V = volume , in cubic metres, of the empty reverberation room [m<sup>3</sup>]  
 c<sub>1</sub>, c<sub>2</sub> = the propagation speed of sound in air, in [m/s], calculated using the formula  
 (in function of the temperature in the room during the test)  
 c=331 + 0,6 t with t= the air temperature in degrees Celsius  
 for temperatures in the range of 15°C to 30°C  
 T<sub>1</sub>, T<sub>2</sub> = the reverberation time, in seconds, of the empty reverberation room resp. with test specimen in [s]  
 m<sub>1</sub>, m<sub>2</sub> = the power attenuation coefficient, in reciprocal metres, calculated according to ISO 9613-1:1993  
 A<sub>T</sub> = The equivalent sound absorption area of the test specimen in square metres  
 S = the area, in square metres, covered by the test specimen  
 α<sub>s</sub> = the sound absorption coefficient

#### RATING OF SOUND ABSORPTION

---

##### **$\alpha_p$ PRACTICAL SOUND ABSORPTION COEFFICIENT**

Frequency-dependent value of the sound absorption coefficient which is based on measurements on one-third-octave bands in accordance with ISO 354 and which is calculated in octave bands in accordance with the standard ISO 11654:1997.

The practical sound absorption coefficient,  $\alpha_p$ , for each octave band i, is calculated from the arithmetic mean value of the three one-third octave sound absorption coefficients within the octave. The mean value is calculated to the second decimal and rounded in steps of 0,05 and maximized to 1,00 for rounded mean values > 1,00

##### **$\alpha_w$ WEIGHTED SOUND ABSORPTION COEFFICIENT**

The weighted sound absorption coefficient is determined as a single number value from the practical sound absorption coefficients from 250 Hz to 4000 Hz. The practical sound absorption coefficient is calculated according to ISO 11654:1997.

Single-number frequency-independent value which equals the value of the reference curve at 500 Hz after shifting is as specified in the standard ISO 11654:1997.

##### **SHAPE INDICATORS, L,M,H**

Whenever a practical sound absorption coefficient  $\alpha_p$  exceeds the value of the shifted reference curve by 0,25 or more, one or more shape indicators shall be added, in parentheses, to the  $\alpha_w$  value.

If the excess absorption occurs at 250 Hz, use the notation L.

If the excess absorption occurs at 500 Hz or 1000 Hz, use the notation M.

If the excess absorption occurs at 2000 Hz or 4000 Hz, use the notation H.

##### **NRC NOISE REDUCTION COEFFICIENT**

The NRC is a single-number index determined in a lab test and used for rating how absorptive a particular material is. This industry standard ranges from zero (perfectly reflective) to 1 (perfectly absorptive). It is simply the average of the mid-frequency sound absorption coefficients (250, 500, 1000 and 2000 Hertz) rounded to the nearest 5%.

##### **SAA SOUND ABSORPTION AVERAGE**

NRC is being replaced by the Sound Absorption Average (SAA), which is described in the current ASTM C423-09a. The SAA is a single-number rating of sound absorption properties of a material similar to NRC, except that the sound absorption values employed in the averaging are taken at the twelve one-third octave bands from 200 Hz to 2500 Hz, inclusive, and rounding is to the nearest multiple of 0.01.

**The NRC and SAA results are not within the scope of the accreditation.**

Test results related to tested object only. The test results should not be considered as material constants, the absorption depends not only on the material itself. The method of construction, the size of the material surface and its place in the room, affect the sound absorption characteristics of the test element.

---

#### ACCURACY

---

The accuracy of the absorption coefficients as calculated can be expressed in terms of repeatability of measured reverberation times (tests within one laboratory) and reproducibility (between various laboratories)

The expanded uncertainty under reproducibility conditions, U, is calculated in accordance to the standard ISO 12999-2 for the confidence level of 95%, used the coverage factor k=2

$$U = u^*k \quad \text{with} \quad \begin{aligned} u &= \text{uncertainty under reproducibility conditions} \\ k &= \text{coverage factor (k=2 for a confidence level of 95\%)} \\ U &= \text{expanded uncertainty under reproducibility conditions} \end{aligned}$$

This standard specifies how to calculate :

- the uncertainty of sound absorption coefficients and equivalent sound absorption areas measured according to ISO 354
- the uncertainty of the practical and weighted sound absorption coefficients determined according to ISO 11654

The numbers given are derived from inter-laboratory measurements with different types of test specimens including suspended ceilings, mineral wool, foams.
